Turnkey

We can design and engineer your project, provide the best hardware and software for the charging needed, oversee installation and provide maintenance and repair once the chargers are installed. All to fit your budget and timeline.

Hardware

We offer a variety of charging station options from the most reliable manufacturers, utilizing OCPP. We have Level 2 stations (including high-power AC) and DCFC stations for passenger, light, medium and heavy duty applications. Stations are available for purchase or to save on upfront costs, we offer OpConnect as a Service (OpaaS), which allows for a single monthly or annual payment that includes hardware, software and maintenance.

Software

Our cloud-based software platform provides payment processing, scheduling, maintenance ticketing, and 24/7 tech support. The OpConnect dashboard provides real time status of charging stations, access to usage reports, allows you to adjust pricing, speed of charging and load management. OpConnect provides a driver app for locating stations, making payments and tracking usage.

Connectivity

In addition to cellular, Wi-fi and ethernet connectivity options, OpConnect has a proprietary solution that features a Bluetooth connected charging station. This eliminates the cost for cellular service, works in any location, including underground parking and rural areas with limited or no cell service. This solution provides the lowest operating expenses in the industry.

Private Label

We license our EV charging software platform so organizations can easily stand up their own charging network. This solution allows utilities, fleets, OEMs, cities, and municipalities to have their own charging network with branded dashboard and driver app.
